CCR DEADLINE TO MSDH & CUSTOMERS: BY JULY 1, 2021

2020 Annual Drinking Water Quality Report Wallerville Water Association, Inc. PWS#: 0730009 April 2021

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning your water utility, please contact Kevin McBrayer at 662.534.4147. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the first Monday of each month at 7:00 PM at 1534 CR 107, New Albany, MS 38652.

Our water source is from wells drawing from the Eutaw Formation Aquifer. The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Wallerville Water Association, Inc. have received a moderate susceptibility ranking to contamination.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to December 31st, 2020. In cases where monitoring wasn't required in 2020, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) — The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Contaminant Violation Date Level Range of Detects Unit MCLG MCL Likely Source Ty/N Collected Detected or # of Samples Managery

^{*} Most recent sample. No sample required for 2020.

Disinfection By-Products.

Chlorine. Some people who use water containing chlorine well in excess of the MRDL could experience irritating effects to their eyes and nose. Some people who drink water containing chlorine well in excess of the MRDL could experience stomach discomfort.

As you can see by the table, our system had no contaminant violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected however the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During December 2020, we did not complete all monitoring or testing for Chlorine residuals and therefore cannot be sure of the quality of our drinking water during that time. This was due to a clerical error. Did not label sample card correctly.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

The Wallerville Water Association, Inc. works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

Note: You may contact Wallerville Water Association, Inc. Billing office for a copy of the CCR.

2020 Annual Drinking Water Quality Report Wallerville Water Association, Inc. PWS#: 0730009 April 2021

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continuely improve the water treatment process and profect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning your water utility, please contact Kertin McGrayor at 662-534.4.147. We want our valued customers to be informed about their water utility. If you want to fear more, please attend any of our regularly scheduled meetings. They are field on the first Monday of each month at 7:00 PM at 1534 CR 107, New Alberty, MS 30652.

Our water source is from wells drawing from the Eutow Formation Aquifer. The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contemination. A report containing detailed vinderation on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The water for the Water-Masociation, Inc. have received a moderate susceptibility details.

We routinely ranking to contaminate in your disking writer according to Federal and State laws. This habit below lists all of the drinking water contaminants that we detected during the period of January 1° to December 31° 2020. In coses where monitoring water required in 2020, the table reflects the most recent results. As water travels over the statutes of land or december of sample of the contaminant from the presence of animals or from human activity, inscribial conteminants, such exists and in some cases, redocute materials and can pick up substances of the expectation of the presence of animals or from human activity, inscribial conteminants, such exists and the conteminant from the expect presence of the presence of the expectation of the expectations, and wildlife; long-period contaminants such as agriculture, appreciations to be naturally occurring or result from urban storm-writer standt, industrial or demestic wastewise discharge, oil and size industrial or demestic wastewise discharge, oil and size in the contaminants in the state of the contaminants in the state of the contaminants in the state of the contaminants of the state of the contaminants of the state of the contaminants of the contaminants. The contaminants is water provided by public water systems. All disning water, and the state of the contaminants of the contaminants of the contaminants of the contaminants. It is important to remember that the presence of these contaminants does not necessarily indicate that the water posses a health risk.

In this table you will this many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the tiest evaluable treatment technology.

Maximum Contaminant Level Goal (ACCLO) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Distributant Level (MRDL) - The highest level of a distributant allowed in drinking water. There is convincing wildence that addition of a distributant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MROLG) — The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Unificient & Unifici

As you can see by the table, our system had no contaminant violations. We're proud that your drinking water meets or exceeds all Federal and Dinte requirements. We have learned twoogn our monitoring and testing that some considerant have been detected nowever the EPA has determined that your water IS SAFF at these levels.

We are required to monitor your dinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our dinking water meets health standards. During December 2020, we did not complete all monitoring or clerical error. Did not label sample our correctly.

If present, elevated levels of fead can cause serious health problems, especially for pregnant women and young children. Lead in dinking water is premarily from materials and components associated with service lines and home plumbing. Our water cystem is responsible for providing high quality dinking water, but cannot control the vanety of materials used in plumbing components. When you water has been sitting for reviewal hours, you can minimize the potential for lead exposure by flushing your tap for 30 excends to 2 minutes before using water for dinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested, following the individual water, testing methods, and steps you can take to minimize exposure is available from the Sate Dinking Water Hotsine or at http://www.eps.gov/hafewetor/fead. The Messaksiph State Department of Health Public Health Laboratory offers lead leating. Please contact 801.576.7582 if you wish to have your water tested.

All sources of diricking water are subject to potential contermination by substances that are naturally occurring or man made. These substances can be inforced by contain all least small amounts of some containinants. The presence of contaminant does not necessarily indicate that the wist posters a health risk. More information about conteminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Orinking Water Hotine at 1,500,420,4791.

Some people may be more vulnerable to contaminants in diniking water than the general population, immuno-compromitted persons such as persons with cancer undergoing chemotherapy; persons who have undergoing organ fransplents, people with HIV/AIDS or other immune system contains, seem elderly, and intents can be personately at this from infections. These people should shest advice about diniking water from their health care providers. EAA/DD guidelines on appropriate means to lessen the task of infection by cryptosporation, and other microbiological contaminants are available from the Sate Drinking Water Hotino 1,800,426,4791.

The Welferville Waster Association, inc. works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future

Note, You may contact Weserville Water Association, Inc. Biting office for a copy of the CCR.
